

Mini Project: Cohort 21: Forest Fire Ignition Risk

Date:06/03/2026

In today's meeting, our team discussed the new mini project titled Forest Fire Ignition Risk. We began by understanding the problem statement and the objective of the project. The main aim of this project is to study the environmental conditions that may lead to forest fires and to analyze how different factors contribute to fire ignition.

During the discussion, we talked about possible factors such as temperature, humidity, wind speed, rainfall, and other environmental conditions that might influence the occurrence of forest fires. The idea is to analyze these factors using data and develop a model that can help estimate the risk of forest fire ignition.

After understanding the project clearly, we proceeded to divide the roles and responsibilities among the team members. Each member was assigned a specific role such as data collection, data preprocessing, model building, evaluation, and documentation.

We also briefly discussed the overall workflow of the project, including collecting a suitable dataset related to forest fires, preparing the data for analysis, building machine learning models, and evaluating their performance.

Roles:

Data Team:

Bhavana Suresh

Rachana M L

Mandira P Gowda

Disha Prakash

Model Builder Team:

Yashwanth Ashok

Manav Mahesh

Vishnu R Nair

Bharthesh N P

Evaluators Team:

Sowjanya R

Aishwarya S Koti

Risul Dev

Suhani C N

Documentation Team:

Afra Fathima

Rajesh

Rakshitha K

Overall, the meeting helped the team gain clarity about the project objective, workflow, and individual responsibilities. The next step for our team will be to begin exploring and collecting the required dataset for the project.
